## How to clean the Supernova One

FRONT

PROJECTION

SCREENS

### SCREEN IMAGE AREA

**Slightly dusty** Dust with a feather duster or something similar. Light vacuum cleaning is possible, but make sure to use a fitting with bristles that are neither too soft nor scratch the surface.

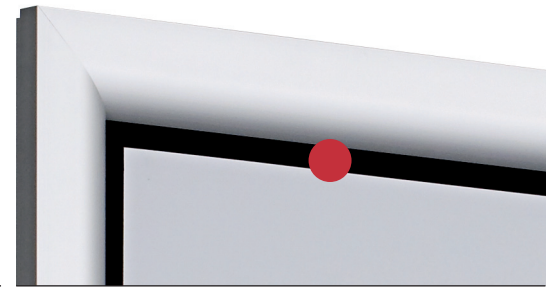

**Dirty** Use an ordinary window cleaner with ammonia or alcohol. Treat the entire image area and clean with a paint pad or lint-free cloth. Make sure the screen is completely dry afterwards.

### BLACK FLOCK AREA

**Slightly dusty** Dust with a feather duster or something similar. Light vacuum cleaning is possible, but make sure to use a fitting with bristles that are neither too soft nor scratch the surface.

**Dirty** Clean with a gentle detergent solution. Apply with a small brush. We recommend a soft toothbrush. Dry with a lint-free cloth or with a hairdryer on a low heat setting.

### FRAME AREA

**Slightly dusty** Dust with a feather duster or something similar. Light vacuum cleaning is possible, but make sure to use a fitting with bristles that are neither too soft nor scratch the surface.

**Dirty** Use a standard detergent for household cleaning – never harsh acidic or alkaline cleaners, as they may stain the frame. Take care to avoid scratches. Dry with a lint-free cloth.

**Warning!** Never use detergent solutions that will leave a film or layer on the surface. Also, never rub the screen hard and persistently to remove stains, as this could cause permanent damage to the screen surface.

Should these treatments prove inadequate, please contact your local dnp distributor or dnp denmark.
